

Onsrud Cutter LP

Libertyville, Illinois, USA

World leader in router bit manufacturing and dedicated to being the cutting tool of choice

Onsrud Cutter has been the world leader in router bit manufacturing since 1920 with the advent of the router by Oscar Onsrud. The company has been a reliable source of high spindle speed tooling for the non-ferrous, wood and plastic markets where consistent quality and performance of tooling is essential. The companies involved in these markets are among the most demanding industrial users and have depended heavily on the ability of Onsrud Cutter to manufacture router bits specific to their respective applications.

Onsrud Cutter manufactures tooling for all types of routers, but specializes in the area of CNC equipment, where close tolerance and extended tool life is critical. It remains the lone router bit manufacturer in the United States that manufactures high speed steel, carbide tip, solid carbide and diamond coated router tooling.

Onsrud Cutter developed the first router bit directed at the plastics industry

in 1986. Today, the offering of tools relative to plastic machining numbers in the hundreds with an emphasis on finding the right tool for the job. Tools are designed for a specific material with a precise chipload to enhance the overall goal of good part finish. The documentation of this goal can be viewed on the Internet at www.plasticrouting.com. This informative web site allows the end-user to determine correct tooling and cutting properties by plastic brand name or generic classification.

Other informational sources available from Onsrud Cutter include its web site at www.onsrud.com. This site offers a wealth of information and valuable links to articles concerning the area of plastic machining. The newly redesigned catalog, which can be ordered off the web site, provides helpful information regarding tool selection, feeds and speeds, and other services from Onsrud Cutter.

While the tooling is the basis for serv-

ing the plastic machining market, experienced engineering and field support augment the implementation of actual application. In order to open all these resources to the end-user, Onsrud Cutter recently launched the "On-Call" program. "On-Call" is an exclusive no-charge service which includes comprehensive training, technical support, on-site trouble shooting and custom tool design.

Onsrud Cutter continues to make a tremendous commitment to the machining of plastic through participation in industry seminars, development of tooling and the "On-Call" program. No matter the machinery or the material, Onsrud Cutter is dedicated to being the cutting tool of choice.
